CHALLENGE - OPTIMIZATION

Low power consumption for IoT and wearables implies that logic blocks in the SoC operate at very different optimal frequencies.

A clock network must be controlled to ensure the right timing of operations constrained by BoM cost, silicon area, power consumption, accuracy and stability.

The Always-On domain, over which the power islets emerge, requires a specific panoply of voltage regulators and clocks. The availability of extremely low power oscillators is therefore a must.

In low power modes, low speed clocks are generally used. The qOSCR-32k-co.01 - low frequency crystal oscillator - is an excellent choice for application combining the needs of ultra-low power consumption and reduced BoM cost.

It can also be suitably combined with a crystal oscillator in order to benefit at once from fast wake-up time of the RC oscillator and from accuracy of the crystal.

SYNOPSIS OF A TYPICAL CLOCK NETWORK

APPLICATIONS

- IoT, wearables
- Battery powered systems
- RTC

KEY BENEFITS

- Low power consumption
 - ➔ Support of low power and backup modes thanks to its 70 nA typical power consumption
- A cost-efficient solution
 - ➔ No external component is needed thanks to on-chip integrated capacitors, thus enabling to offer a low BoM solution for end-users and to minimize the PCB area
- Suitable for fast wake-up
 - ➔ Thanks to a startup time of 200 us, the RC oscillator allows SoCs reaching high performances of wake-up time
- Digital trimming
 - ➔ Allows to compensate process errors in order to obtain the nominal frequency
